## The Golden Retriever Club of America National Health Survey 1998-1999

Prepared by: Purdue University School of Veterinary Medicine Dr. Larry Glickman, Nita Glickman, \& Roland Thorpe
In Consultation with: Golden Retriever Foundation,
Board of Directors of the Golden Retriever Club of America, Health \& Genetics Committee of the Golden Retriever Club of America

About the cover:

The Golden Retriever pictured on the front cover is Landmark First Class Oliver, UD owned by John Cotter. Ollie was born on 10/30/99 and is 9 years old in this picture.

With this survey, we hope to find ways to positively impact the lives of all Golden Retrievers. The Golden Retriever Foundation

## APPENDIX I - COPY OF THE 1998 GOLDEN RETRIEVER CLUB OF AMERICA HEALTH SURVEY

## I. Introduction

The number of dog breeds recognized by the American Kennel Club is currently approaching 150. While each dog breed originated from a relatively small gene pool, selective breeding for desirable physical traits such as height, coat color, and head shape, has produced a canine species that is unique among mammals, with normal adult body weight ranging from approximately 4 to 180 lbs . This wide disparity in normal body size is associated with great differences in longevity between the smaller and larger breeds. Also, there are many diseases that occur with greater frequency in larger dogs such as bone cancer, cardiomyopathy, and hip dysplasia. Further evidence for the effect of selective breeding is that mixed breed dogs generally live longer and have a lower incidence of most diseases than do purebred dogs of the same size. For these reasons, the canine pet population must be evaluated breed by breed in order to characterize the general state of health and well being.

There are few existing sources of data that can be used to assess the health and longevity of purebred dogs. Veterinary hospital based information is available through the national computerized Veterinary Medical Data Base (VMDB) which is housed at Purdue University and contains information on hospital visits for more than five million dogs and cats. However, the VMDB primarily includes animals referred to veterinary teaching hospitals in North America, because of severe or live-threatening conditions that are difficult to diagnosis and treat in private veterinary practice. Thus, these dogs are not representative of the general pet population. Formal breed health surveys and genetic screening of some breeds have been conducted to measure the prevalence of suspected genetic diseases and to identify individual animals who may be carriers of these inherited diseases. Few of these health surveys however, have been comprehensive in nature and inclusive of the full spectrum of health conditions that affect pet dogs. Persons unfamiliar with the principles of research design and statistical data analysis designed many of these breed surveys.

The breed survey described in this report represents a collaborative effort between the Health and Genetics Committee of the Golden Retriever Club of America and the Clinical Epidemiology Section of the Purdue University School of Veterinary Medicine. The primary objective was to describe the frequency and pattern of occurrence of health related conditions and causes of death
in Golden Retrievers. A secondary objective was to relate physical traits, diet, environment, and personality of individual animals to certain diseases and longevity. We hope the results of this survey will serve to better familiarize veterinarians and owners with the Golden Retriever breed and provide the Golden Retriever clubs with information that can be used to prioritize future health-related research and disease prevention efforts. It should serve to stimulate further studies on the causes of diseases that affect Golden Retrievers.

## II. Methods

The Health and Genetics Committee of the Golden Retriever Club and Dr. Larry Glickman from Purdue University School of Veterinary Medicine developed the questionnaire used in this survey. The club mailed the questionnaire to all members and placed a copy on the club's home page on the World Wide Web in 1998. Each owner was asked to complete a separate questionnaire for up to five dogs that were alive on January 1, 1993. Seven hundred and forty six owners submitted usable responses directly to Purdue University for 1444 Golden Retrievers.

Information on the questionnaires was coded and entered into a computer database after all personal identifiers were deleted, in order to keep the information confidential. A software application called Epi Info version 6.04 developed by the Centers for Disease Control and Prevention (Atlanta, GA) was used for data entry and SAS System version 6.12 was used for data analysis. SAS is a comprehensive data management and analysis software application from the SAS Institute (Cary, NC). A probability ( P ) value of $<0.05$ was used as a measure of statistical significance.

Golden Retriever National Health Survey
Number of Years Survived Since 1993

## Interpretive Summaries and Comments on the Results

## Tables 1a \& b

1. Seven hundred and forty six dog owners returned usable questionnaires. It was not possible to determine the exact response rate, since the questionnaire was also placed on the web as well as mailed directly. To our knowledge, this is the largest breed survey conducted to date.
2. Of the 1444 Goldens entered into the survey that were alive on January 1, 1993, $556(38.5 \%)$ died in the ensuing five years. Of the 556 deaths, $335(60 \%)$ were the result of euthanasia and the remainder (40\%) occurred naturally. These deaths were used to calculate cause-specific death rates. The proportion of bitches and dogs that died was $37.1 \%$ and $38.5 \%$, respectively.
3. A veterinarian $77.3 \%$ of the time confirmed the cause of death, but a necropsy was performed for only 80 ( $14.4 \%$ ) of all deaths. Thus, many underlying causes of death probably went undetected.
4. The majority of owners (about $60 \%$ ) live with $2-5$ Goldens and have been in the breed for $>10$ years.
5. The majority of participants in this survey were interested in their dogs as companion animals (82\%) for obedience (73\%) and for conformation (58\%) purposes. Only 30\% and $25 \%$ expressed an interest in agility or hunting and field trials, respectively.

## Table 2

1. Approximately $84 \%$ of the bitches and $57 \%$ of the dogs had been neutered and this was performed at a mean age of 4 years.
2. The mean age of the participating Goldens in 1993 was approximately 5 years.
3. The mean age for 294 bitches that died was 11.3 years versus 10.7 years for 252 dogs. In dogs as in humans, females generally outlive their male counterpart.
4. The mean weight of the bitches and dogs in the survey was 64.1 and 75.4 lbs ., respectively.
5. The mean height of the bitches and dogs in the survey was 22.1 and 23.8 in, respectively.

## Table 3a

1. About half of the bitches had never whelped a litter. Of the remainder, $16 \%$ had whelped one litter. The maximum number of litters whelped was 4.
2. The first litter was whelped at a mean age of 3.3 years and the fourth litter at 6.5 years.
3. The mean number of live born pups per litter was about 7.5 and this decreased only slightly with increasing litter order. There was a mean of approximately 0.7 stillborn pups per litter and this did not increase significantly with increasing litter order.
4. Almost all of the live born puppies per litter were weaned, indicating a very low neo-natal mortality rate.

## Table 3b

1. Most litters resulted from natural breeding; the second most common method used was artificial insemination with fresh semen.
2. When controlling for litter order, the mean number of live born puppies per litter was higher for litters resulting from natural breeding compared with artificial breeding. However, one cannot tell from this data if the difference in litter size occurred because bitches that were bred artificially had a prior history of reproductive problems such as failure to conceive using natural methods.

## Table 3c

1. The mean number of puppies live born per litter resulting from natural breeding (7.7) was higher than for any of the artificial breeding methods. However, this is difficult to interpret as explained above (Table 3b-comment 2).
2. The mean number of stillborn puppies per litter (1.1) was slightly higher for the liters resulting from artificial insemination using fresh semen than for litters resulting from natural insemination (0.8).

## Table 4

1. Most bitches were bred to produce offspring for use as pets ( $61 \%$ ), followed by dogs for conformation (54\%), or for obedience (40\%). Very few Goldens were specifically bred for hunting, tracking, or agility.
2. Approximately one-fourth of the Goldens in this survey had never competed at a show. The largest proportion had competed in obedience trials ( $67 \%$ ) followed by conformation shows (48\%), and field events (31\%).

## Table 5

1. The largest proportion of Goldens in this survey had been whelped in another home ( $40 \%$ ), followed by in a kennel (34\%), or in one's own home ( $22 \%$ ). Few had been rescued, adopted or obtained in a pet store.
2. The vast majority ( $83 \%$ ) of the Goldens was kept primarily in the house or in a kennel ( $10 \%$ ). Very few were crated (2\%)
3. The majority of the Goldens ( $65 \%$ ) slept in the owner's bed at least some of the time. This finding is similar to that reported for other pet dogs in the United States and indicated that these animals are considered part of the "human" family.

## Table 6

1. The mean weight of bitches and dogs was constant until about 13 years of age and then declined significantly. As in humans, this indicates that malnutrition is common in the oldest animals and they should be fed foods of higher caloric density. Such life-stage commercial dog diets are becoming more available for the eldest of the old.
2. In contrast to weight, height remained fairly constant with age. In humans, declining height is associated with age due to weakening of bone structure (osteoporosis), but this same phenomenon has not been reported to occur in dogs.
3. In humans, body mass index calculated as body weight/height ${ }^{2}$, is often used as a measure to assess risk of chronic disease. However, because dogs come in such a variety of heights and body shapes, we created used a different measure of body mass index, namely weight/height. Later in this report, this measure is related to the occurrence of different diseases in Goldens.
4. The information contained in this table may be useful to the Golden Retriever Club in reassessing breed standards for height and weight.

## Table 7

1. Puppies fed to achieve a maximum growth rate are not taller as adults, but they do weigh more than puppies fed for average or slow rates of growth. For this and other reasons addressed later, I recommend that a puppy's rate of growth not be pushed.
2. There is a very significant correlation between the body condition of Goldens as reported by their owner and the Golden's actual weight or body mass index. This makes me confident
that owners can objectively assess the body condition of their animal in health surveys. Note, there was no obvious relationship between body condition and height.
3. As expected, bigger boned Goldens tend to weigh more, be taller, and have a greater body mass index.

## Table 8a \& b

1. The large majority ( $87 \%$ ) of adult Goldens were fed at least some dry food on a daily basis, whereas only $12 \%$ were fed canned food daily.
2. Only $5 \%$ of owners of adult Goldens reported never feeding dry dog food.
3. Only about $5 \%$ of owners of adult Goldens reported cooking for their dog or feeding table scraps on a daily basis
4. Most adult Goldens are fed dry food twice daily ( $70 \%$ ) while $21 \%$ are fed once daily. Multiple daily feedings have been shown to reduce the risk of gastric torsion in large breed dogs.

## Table 9a \& b

1. While $87 \%$ of adult Goldens were reported to be fed some dry food daily, the proportion of senior Goldens fed dry food daily was $78 \%$.
2. More senior Goldens appear to be fed some canned food daily ( $17 \%$ ) compared with adult Goldens ( $12 \%$ ). As noted elsewhere in this report, the oldest Goldens appear to lose weight and body condition and this may explain why more owners are adding canned food to the diet.

## Table 10

1. Owners were asked to provide us with a list of ingredients for the dry and canned foods they fed most often. The most common first ingredient for dry food was red meat followed by white meat and some type of plant protein, usually soy. The first two ingredients listed for the canned foods were also red meat and white meat.

## Tables 11a \& b

1. The most commonly fed ingredient in foods prepared by owners was white meat, followed by unspecified types of meats, vegetables, red meat, and yogurt. Fish was prepared for very few animals.
2. Other types of foods fed regularly included dog biscuits/treats and eggs.

## Table 12

1. Thirty nine percent of owners gave their adult Golden a daily multivitamin supplement while $19 \%$ did so for their senior animals. It seems to me that seniors would have greater need for multivitamins than would adults.
2. A similar relationship held for daily mineral supplements, which was given to $12 \%$ of adults, but to only $7 \%$ of seniors.
3. Other types of supplements were given daily to $17 \%$ and $20 \%$ of adult and senior Goldens, respectively. However, the types of supplements given were so varied, it was difficult to categorize them. They included herbs, cartilage-building substances such as glucosamine, brewers yeast, specific vitamins, etc.

## Table 13a

1. This table describes the relationship between the type of foods consumed daily and body condition. Overall, $95 \%$ and $14 \%$ of adult Goldens consume dry and canned dog foods daily, respectively, and this does not seem to differ significantly with body condition. In contrast, only $8 \%$ of adult Goldens consume table scraps, but this proportion is higher in underweight animals ( $15 \%$ ). Two interpretations are possible: either feeding table scraps causes dogs to be underweight, for example, by displacing more balanced dry foods from the diet, or more likely, table scraps are preferentially fed to dogs whose owners judge them to be underweight.
2. Overall, $82 \%$ and $20 \%$ of senior Goldens consume dry and canned dog foods daily, respectively. However, dry dog foods were fed less frequently (69\%) to underweight animals and canned foods more frequently $35 \%$ ) to overweight animals. As with adult animals, table scraps are more likely to be fed to underweight animals (31\%) than to senior
animals in general ( $21 \%$ ). A similar relationship exists for home prepared foods, which is more commonly used in underweight senior dogs.

## Table 13b

1. This table relates the type of foods fed to adult and senior dogs with their weight, height, and body mass index.
2. The feeding of different types of foods showed no obvious relationship to body size, except as noted previously, senior Goldens that received home prepared foods or table scraps tended to weigh less than those not being fed such foods.

## Table 14

1. The vast majority ( $74 \%$ ) of owners fed their Golden as a puppy to achieve an average rate of growth while only $3 \%$ were trying to maximize the rate.
2. Most $(87 \%)$ of the Goldens in this survey were reported to be in optimal body condition as a puppy or an adult, while about $3 \%$ and $11 \%$ were overweight or obese as a puppy or an adult, respectively. This differs from published studies of pet dogs in which approximately onethird are considered to be overweight. This may reflect the fact that many Goldens in this study were show dogs, or Goldens are less prone to obesity than such breeds as the Labrador Retriever, and Miniature Poodle.
3. Most ( $63 \%$ ) of the Goldens were reported to be medium boned while $24 \%$ were large boned.

## Table 15

1. As part of a long-range project, we are trying to characterize the personality of different breeds. This information is very useful to individuals trying to decide what breed to acquire.
2. Owners on a scale of $1-10$ scored each of 10 personality traits. Based on these ratings, Goldens ranked highest for being happy, trainable, and active. The breed scored the lowest on aggressiveness to dogs and people and on fearfulness.
3. Personality of dogs should continue to be one of the most important traits considered when selecting animals for breeding. After all, these personality traits are what makes the Golden such a desirable pet.

## Table 16

1. As expected, virtually all Goldens in this survey received regular vaccination. Only 5 (< $0.5 \%$ ) of owners reported their animal never having received a distemper or parvovirus vaccination. About $7 \%$ of owners reported their Golden received a distemper or parvovirus vaccination less frequently than once a year. One might expect the proportion of dogs receiving yearly vaccination to decrease in the future due to concern over vaccine-induced autoimmune diseases and published evidence that the immunity resulting from distemper and parvovirus vaccination lasts significantly longer than one year, and perhaps for life.
2. All but two Goldens in the survey had been previously vaccinated against rabies with most ( $49 \%$ ) receiving it every three years.
3. Forty-seven percent of Goldens were never vaccinated against Lyme disease while $13 \%$ were not vaccinated against kennel cough. The need for Lyme disease will vary by geographic region, but all Goldens should be considered at risk for kennel cough and be immunized yearly using a parenteral or preferably an intranasal vaccine.

## Table 17

1. Most ( $86 \%$ ) Goldens receive medication either daily or monthly to prevent heartworm infection.
2. Yearly routine worming for intestinal parasites is practiced by $23 \%$ of owners. Most dogs receive worm medications sporadically as needed.

## Table 18

1. This table describes the frequency of contact with lawn chemicals, insecticides, and water outside the home.
2. More than half the Goldens were reported to never have contact with owner or commercially applied lawn chemicals. The reliability of this information is uncertain, since the meaning of the term exposure was not clearly defined in the questionnaire. Similarly, approximately half of the Goldens were reported as never having been exposed to flea or tick products.
3. Goldens are often swim in fresh water outside the home, $26 \%$ on a daily basis. Immersion in pool or salt water is much less common. The club requested this question, and I am not sure of its significance.

## Table 19

1. Twenty-six owners in this survey reported seeking professional counseling or behavior modification for their Golden. Twenty individuals received some type of medical treatment for a behavior problem and 14 ( $1 \%$ ) were considered for euthanasia as a result. This indicates that severe behavioral problems are infrequent in Goldens, but the frequency of these conditions merit continual monitoring.

## Table 20.

1. Owners were asked to list what they thought were the three most important health-related conditions in the breed. It should be noted that the term "important" was not further defined. Neoplasia was ranked first by owners followed by hip dysplasia and cardiovascular disease. This is consistent with the survey results showing that neoplasia accounted for $>60 \%$ of all reported deaths. However, in terms of its frequency of occurrence, hot spots followed by hypothyroidism were the most common health conditions reported with a lifetime risk of 1 in 3 and 1 in 4 , respectively.
2. It appears that what one owner considers important might not be important to another. For example, some might consider as important only a condition that results in high mortality (e.g., cancer), while others might focus on how common or difficult to control a condition might be (e.g., hypothyroidism and epilepsy).

## Table 21

1. This table constitutes the real meat and potatoes of this survey. It describes the frequency of occurrence of veterinary confirmed health related disorders by organ system/disease type. Within each category, we present both the total number of incidents and the total number of individuals affected, because each individual could have had more than one episode of a given condition.
2. The most frequently reported health problems were related to the skin and coat. However, the most frequently reported life-threatening conditions were a wide variety of cancers. Among the cancers, hemangiosarcoma and lymphosarcoma were the most common. Lipoma occurred more frequently, but it is benign and not life threatening. Other very commonly reported problems were musculoskeletal, allergic, and parasitic.
3. It is often difficult to precisely categorize a condition. For example, a dog with cardiomyopathy may have a heart murmur or arrhythmia due to cardiomyopathy. However, cardiomyopathy may not have been diagnosed. Also, a Golden with cardiomyopathy may develop heart failure, but only heart failure and not cardiomyopathy could have been reported in the survey. Both of these situations would lead to an under-reporting of cardiomyopathy.
4. No attempt was made in this survey to document what procedures or tests veterinarians used to confirm each condition.

## Table 22

1. This table expands on the previous table. For each condition it shows the number and percent of individuals that were treated and cured. For some cancers like osteosarcoma, the cure rate among those individuals treated was low (27\%) while for others like squamous cell carcinoma the cure rate was relatively high (89\%). This information indicates where better treatments are needed.
2. Other fairly common conditions with a low cure rate include food allergy (44\%) and fleabite dermatitis ( $50 \%$ ). Fortunately, while hot spots are the most frequently reported condition in the breed, the cure rate is reported to be $84 \%$. However, the condition is likely to recur. Ear infections and tracheobronchitis (kennel cough) typically follow a similar pattern.

## Table 23

1. A disease may be important not only because it occurs in high frequency, but also because it affects younger animals and may contribute to premature mortality. For example, most cancers occur in relatively older animals ages 8-10 years, whereas allergies hypothyroidism, and epilepsy tend to occur in younger animals.
2. When describing the frequency and pattern of some diseases, it is important to distinguish between dogs and bitches.

## Tables 24, 25a, \& 25b

1. These tables describe the pattern of disease for all Goldens combined and separately for bitches and dogs, in each of three age groups, namely 0-2.9, 3-7.9, 8-12.9, and $13+$ years.
2. The prevalence of disease is expressed as the percentage of individuals within the specified age group that develop the diseases indicated.

## Table 26

1. This table is similar to Tables $24 \& 25$ in that it describes the frequency of occurrence of different conditions by age. However, the method used to calculate the frequency in this table is very different. In previous tables disease frequency was based on the number of incidents or individuals affected which provides no measure of the probability (risk) that any individual will develop a specific disease in a given unit of time or over an entire lifetime. In this table, the frequency is expressed as the incidence rate per 1000 dog years at risk. The frequency is expressed this way because dogs were of different ages at the start of the survey in 1993. Thus, individual Goldens may have been observed for varying lengths of time. In using dog years at risk as the reference, one dog living for one year would contribute one dog year at risk.
2. In order to get some idea of how dog years at risk relates to lifetime risk, one can assume that the average lifespan is about 10 years and then divide the rate in dog years by 100 to obtain a lifetime risk (i.e., 1000 years $=10010$-year lifetimes). For example, if one takes the risk of neoplasia for dogs 3-7.9 years of age, which is 32 per 1000 dog years at risk and divides it by 100 , it gives you .32 cases of neoplasia per lifetime. One can then multiply this by 100 to get the lifetime risk of neoplasia as a percentage, which gives you $32 \%$. This means that the lifetime risk of a dog developing any neoplasia is approximately $32 \%$ or 1 in 3 , provided that this rate persisted over the dog's entire 10-year lifetime. However, we know that this rate is lower earlier in life and then increases markedly later in life.
3. A better way to estimate the lifetime risk of developing a disease or condition is to just utilize animals that have died (i.e., that lived their entire lifetime). This approach is shown in Table 37 where the lifetime risk of neoplasia is estimated at 1 in 2 or approximately $50 \%$.

Table 27

1. In humans, body condition is a good predictor of the probability of developing many chronic conditions over time including adult onset diabetes, cardiovascular disease, and some cancers, e.g., breast. Such relationships have not been evaluated however, in animals. In this table, we examined the relationship between body condition, both as a puppy and an adult, with the occurrence of specific health disorders. Comparisons of body condition were made between animals with specific conditions and all those without this condition. A probability
$(\mathrm{P})$ value $<0.05$ indicates a statistically significant association. In other words, a P value $<0.05$ means that we would expect to observe an association like the one shown less than $5 \%$ of the time due to chance.
2. There was a significant association between being overweight as either a puppy or an adult, and the occurrence of any musculoskeletal condition. For example, $57 \%$ of adult dogs that were overweight as puppies developed a musculoskeletal condition compared with only $33 \%$ that were average weight as puppies. Forty two percent of adult dogs that were overweight as adults developed a musculoskeletal condition compared with only $33 \%$ that were average weight as adults. Thus, being overweight is a risk factor for musculoskeletal disease, and being overweight as a puppy has a stronger effect than being overweight as an adult.
3. The relationship between being overweight as a puppy or an adult and subsequently developing hip dysplasia is also highly significant. Once again, being overweight as a puppy is a stronger predictor of developing hip dysplasia than is being overweight as an adult. For example, of the dogs that were overweight as a puppy, $31 \%$ subsequently developed hip dysplasia versus only $17 \%$ for those that were average weight as puppies. The comparable percentages for adults that were either overweight or average weight, as adults were 25 and $17 \%$, respectively.
4. The above findings strongly suggest that keeping a puppy from becoming overweight will result in a significant reduction in the incidence and or severity of musculoskeletal disease in general and hip dysplasia specifically, as an adult. This is a particularly important finding in larger breeds that have a high risk of these conditions. Experimental feeding trials performed in kennels where littermates were randomized to receive either ad lib feeding or restricted caloric feeding support this relationship.

## Table 28

1. Further relationships were explored between body measurements and the probability of developing specific health related conditions. One significant finding was that bitches that were taller were more likely to have hypothyroidism. For example, the percentage of bitches with hypothyroidism in the following height categories 20-21, 22-23, and 24-24 in., was 17 , 21 , and $35 \%$, respectively. However, there was only one case of hypothyroidism in the tallest group of bitches. A similar relationship between height and hypothyroidism was
observed in dogs, but it was not statistically significant. This may turn out to be yet another disease that is related to increasing height, such as osteosarcoma.
2. Based on the finding of an association between hypothyroidism and height in bitches (point \#1 above), additional analyses were performed. The following were the results:
a) Both bitches and dogs neutered at < 1 year of age were significantly taller as adults than those neutered at $>$ or $=1$ year of age or intact animals.
b) There was no difference in weight by neuter status among dogs. However, bitches neutered at < 1 year of age were significantly heavier than those neutered at > or $=1$ year of age or intact bitches.
c) When controlling for any differences in weight and height, bitches neutered at either < 1 year or $>$ or $=1$ year of age had a significantly increased risk of hypothyroidism (approximately $60 \%$ increase) compared with intact bitches.
d) When controlling for any differences in weight and height, dogs neutered at >or $=1$ year of age had a significantly increased risk of hypothyroidism (approximately $80 \%$ increase) compared with intact dogs. The risk of hypothyroidism in dogs neutered at < year of age was increased by bout $50 \%$, but this increase was not statistically significant.
e) The bottom line is there does appear to be an association between neutering and hypothyroidism independent of the effect of neutering on height or weight. This relationship should be studied further before recommendations are made regarding the optimal age for neutering Golden Retrievers.
3. In bitches there was a highly significant association between increasing body weight and the probability of developing hot spots. For example, the proportion of bitches developing hot spots in the following weight categories, 48-61, 62-69, 70-76, and 77+lbs. was 20, 24, 31, and $37 \%$, respectively. A similar, but not statistically significant relationship was observed for dogs.
4. The heaviest bitches weighing $77+\mathrm{lbs}$. were more likely to develop lymphosarcoma ( $10 \%$ ) than were bitches in the other weight categories. This same relationship was not observed for dogs.

## Table 29

1. Flea allergies are common in Goldens, and are treated with a variety of insecticide chemicals. Therefore, we looked for associations between the occurrence of flea allergies and other common diseases.
2. A very strong association was found between flea allergies and hot spots. For example, $67 \%$ of Goldens with flea allergies developed hot spots versus only $24 \%$ of Goldens without hot spots. The nature of this relationship should be explored further to determine if this is related to a common mechanism for flea allergy and hot spots such as hypersensitivity, or results from the use of chemicals to treat fleas.
3. Another possible explanation for the observed association between flea allergies and hot spots is that dogs with fleas scratch and bite their skin, which results in skin abrasions and infection or hot spots. If true, aggressive flea control should reduce the likelihood of hot spots.

## Table 30

1. The club requested that we look for a relationship between the frequency of diseases such as cancer and geographic location.
2. A significant association was found between the occurrence of flea allergies and region of the U.S. For example, flea allergies were more commonly reported in the South Atlantic, South Central, and Pacific regions than in the colder and less humid North Central and Mountain regions. This relationship was expected.
3. An unexpected finding was the highly significant association of region and the occurrence of hypothyroidism. Hypothyroidism was twice as likely to be reported in the Mountain and Pacific regions than in the New England and Mid-Atlantic regions. There are several possible explanations. First, there might be environmental differences between the west and east coasts that favor development of hypothyroidism. However, I am not aware of what these might be. Second and more likely, is that this reflects differences among veterinarians in practice patterns or diagnostic testing for hypothyroidism. This finding should be further evaluated using more stringent criteria for a diagnosis of hypothyroidism than were used in this health survey.

## Table 31

1. An attempt was made to relate the daily diet of Goldens to the frequency of occurrence of more common health problems.
2. The only significant findings were that Goldens fed table/home prepared foods were more likely to have hot spots (40\%) than animals not receiving such foods (28\%). Also, Goldens that were on daily dry food were less likely to be diagnosed with hypothyroidism (22\%) than animals not receiving daily dry food ( $36 \%$ ). However, in both instances, it is not possible to determine if the diet preceded the disease or was changed as a result of the disease. These findings warrant further study. In older cats for example, consumption of canned cat foods may be a risk factor for hyperthyroidism.

## Table 32

1. The club was very interested in looking for a relationship between various types of chemical exposures and the frequency of cancer and other health related conditions.
2. A significant decrease in the frequency of lymphosarcoma was found for Goldens whose owners reported exposure to flea/tick drop, shampoos, and sprays. Similarly, a significant decrease in hemangiosarcoma was found in association with use of flea/tick drops. The results provide no evidence that these products increase the risk of these two cancers in Goldens.
3. A very consistent and statistically significant increase in the frequency of hot spots was found for Goldens exposed to lawn chemicals or flea/tick drops, shampoos, and sprays. To me this raises the possibility that hot spots might result from a chemical hypersensitivity in predisposed animals. These associations require further study to determine what types of chemicals pose the greatest risk and whether there is a dose-response relationship between these exposures and the risk of hot spots.

## Table 33

1. The need for yearly vaccination of dogs and cats is being questioned because of growing concern they may cause autoimmune conditions. We examined the relationship between yearly vaccination for rabies, distemper, and parvovirus and the occurrence of several common health related conditions.
2. The only statistically significant finding is that $31 \%$ of Goldens receiving yearly parvovirus vaccination developed hot spots versus only $20 \%$ in those not vaccinated yearly. This finding provides further evidence that hot spots might be a manifestation of hypersensitivity and that multiple insults (e.g., chemicals or vaccines) may trigger an acute episode. Further research is needed to determine the temporal relationship between parvovirus vaccination and the onset of hot spots. Also, it is not clear if this association holds for all of the parvovirus vaccines available.

## Table 34a

1. This table and the following four figures describe the major causes of death for the 420 dogs that died since 1993 and for whom the cause had been confirmed by a veterinarian.
2. Neoplasms were the major cause of death in Goldens accounting for 65,70 , and $41 \%$ of all deaths in the 3-7.9, 8-12.9, and 13+ years of age categories, respectively. Overall, neoplasms accounted for $61 \%$ of all deaths. In other breeds that we have surveyed such as the Irish Setter, neoplasms accounted for only $23 \%$ of all deaths. No other disease category accounted for more than $10 \%$ of all deaths in Goldens.
3. Approximately $7 \%$ of all deaths were attributed to neurological conditions. Many of the animals in this category had been euthanized late in life for cognitive dysfunction and urinary and bladder incontinence. Cardiovascular causes such as cardiomyopathy accounted for about 5\% of all deaths
4. Because death certificates are not required for all dogs and necropsy exams are infrequently performed, many deaths are attributed to unknown causes (10\%).

## Tables 34 b and c

1. These tables break down the causes of death for dogs and bitches separately.
2. Neoplasms generally kill more dogs ( $66 \%$ ) than bitches ( $57 \%$ ).

## Table 35a

1.Death rates were lower among bitches at all ages up to $13+$ years of age. After 13 years of age, the death rate for bitches ( 449 per 1000 dog years) exceeded the death rate for dogs ( 417 per 1000). This same pattern of death is often observed in other animal species as well, eg., humans.

## Tables 35 b and c

1. Cancer deaths in dogs and bitches occurred in all age groups beginning at 3 years of age. The highest proportion of cancer deaths were in 8-12.9 year old Goldens.
2. The causes of death in dogs and bitches were very similar.
3. Most of the deaths in older animals in the neurological category were probably due to a general decline of cognitive function rather than to a specific disease entity. It is unlikely therefore, that any of these can be prevented. However, there is a drug licensed for dogs that might be useful in slowing the rate of decline in cognitive function.
4. It is likely that if more Goldens were autopsied, the number of deaths in the "unknown cause" category would decline.

## Table 36

1. This table examines the years of potential life lost due to different diseases. The way this is done is to subtract the average age of death for animals dying of a specific condition from the average age of death for all other animals and then multiply this difference by the total number of animals dying of the specific condition. The resulting number describes the total number of years of life that were lost among the 430 Goldens because of a specific disease. Disease that affect younger animals e.g., autoimmune disease, will make a greater contribution than diseases that occur at an older age, e.g., cancer.
2. The greatest number of potential years of life lost among the Goldens that died in this survey was attributed to lymphosarcoma (102 years). Each of the 43 Goldens with lymphosarcoma lost approximately $2.9(11.4-8.5=2.9)$ years of life. In contrast, each dog dying of hemangiosarcoma lost approximately 1.1 years of life. This approach tells you how many years of extra life might be gained if you could completely prevent a specific disease.

## Table 37

1. Probably the easiest way to understand how likely a disease is to affect an individual is to express it as a lifetime risk. In this table we describe the lifetime risk for all of the major health related conditions reported in the survey.
2. The lifetime risk of a Golden developing a neoplasm is approximately 1 in 2 or $50 \%$. Hemangiosarcoma was the most frequently reported cancer with a lifetime risk of 1 in 5 followed by lymphosarcoma with a lifetime risk of 1 in 8.
3. The lifetime risk of breast cancer in Goldens is approximately 1 in 20. Compare this with a lifetime risk of breast cancer in women of approximately 1 in 9 . However, keep in mind that the risk of breast cancer in bitches will be reduced by over $95 \%$ if they undergo ovariohysterectomy before their first heat cycle.
4. While hemangiosarcoma appears to be the most commonly occurring cancer in Goldens, the exact risk of this disease as determined by this survey may not be accurate. Some owners reported that their dog developed a hemangiosarcoma, but did not specify the specific anatomic site. Other owners stated that their Golden developed a tumor of the spleen, but did not know the specific type. We assumed for the purposes of analysis, that all of the primary tumors of the spleen were hemangiosarcoma. This will likely result in an overestimate of the incidence of hemangiosarcoma. Regardless of the exact incidence of hemangiosarcoma in Goldens, clinical experience indicates it is a common cancer and a leading cause of death in the breed.

## Table 38

1. This table describes outcome for the 20 most common health related disorders. Most of the common health related conditions are not life threatening, with the exception of cancer. Seventy percent of the dogs with hemangiosarcoma died during the five-year time frame of the survey. It is likely that some of the surviving dogs with a history of hemangiosarcoma would have died of the disease had they been followed longer.

## Table 39

1. The mean age at death is reported both for Goldens that died of diseases that were confirmed and unconfirmed by a veterinarian. Using either classification of death, the mean ages at death were similar.

## Table 40

1. The mean age at death was compared for dogs that originated from different sources. The longevity of bitches bred in another home was approximately one year longer (11.9 years)
compared with bitches bred in a kennel (10.9 years), or in the owner's home (self; 10.5 years). For dogs, the place where it was bred did not seem to make a difference in lifespan.
2. There were too few Goldens adopted from other owners or purchased from pet stores to make a reliable estimation of longevity.

## Table 41

1 Longevity was significantly related to the height, but not to body weight or body mass. Among bitches and dogs, the taller the animal as an adult, the shorter the lifespan. There was a difference of 1.1 and 2.2 years in the mean age at death between the tallest and the shortest bitches and dogs, respectively. This is the same relationship that is known to exist across different breeds, where the tallest breeds have the shortest lifespan. The difference in mean age at death between the tallest and shortest breeds may be as much as 8 years!!! One interpretation of these findings is that whatever genes control height are also somehow involved with, or near the genes on the chromosomes that control the rate of aging in dogs.
2 The fact that height is highly correlated with longevity, whereas weight is not, can be explained by the fact that height is primarily genetically controlled; in contrast, weight is strongly influenced by environmental factors such as diet and exercise.

## Table 42

1. Neutered bitches and dogs generally live longer than intact animals and the longer neutering is delayed, the greater the effect.
2. The difference in age at death between intact and neutered dogs probably resulted from selection bias rather than from any biological advantage to neutering. For example, for a dog to be neutered at $8+$ years of age, it must first live at least 8 years. Thus, only older dogs fall in this age category and this artificially results in an older age at death. Also, Goldens in this population were probably neutered earlier in life if they had physical or medical problems that made them unsuitable for breeding. Such Goldens would be less likely to live as long as others, which were neutered later in life when their breeding was completed.

## Figure 10

1. This figure describes the probability that dogs of a specified age that were alive in 1993 will live additional years. It is the kind of information used by actuaries to price life insurance policies for people. Such information is not available for pet dogs.
2. This actuarial information can be used to predict how long Goldens of a given age are likely to live. For example, it predicts that approximately half of all Goldens $>10$ years of age will probably die within the following 2.5 years. In contrast, half of the Goldens in the 7-9.9 year age bracket can be expected to live for approximately 5 additional years.
3. Another way to use this information is to express the probability that a dog of a given age will survive for one more year. For dogs $>10$ years of age the one-year survival rate is approximately $80 \%$ whereas for dogs 7-9.9 years of age the one-year survival rate is approximately $96 \%$.

## Appendix I

## 1998 Golden Retriever Club of America Health Survey

A Collaborative Effort of the
Golden Retriever Foundation, Board of Directors of the Golden Retriever Club of America, Health \& Genetics Committee of the Golden Retriever Club of America, and
The Purdue University School of Veterinary Medicine, Section of Clinical Epidemiology
(Dr. Larry Glickman, Head)

The Golden Retriever Club of America (GRCA) and the Purdue University School of Veterinary Medicine would like your participation in a survey to identify the frequency of health related conditions of Golden Retriever dogs. This information will be useful in prioritizing health research resources and will provide a baseline against which to measure the impact of future breeding and health promotion programs. All information collected will be tabulated by Dr. Glickman at Purdue University and a report of the findings submitted to the GRCA for distribution to its members. All responses will be kept confidential, i.e., the names of the respondents will be kept anonymous and separate from the responses. The study is funded by the Golden Retriever Foundation. Its success and accuracy depends on a high rate of cooperation.

Please take the time to complete one questionnaire for each eligible dog and return it promptly to:
Golden Retriever 1998 Health Survey
c/o Professor Larry Glickman
Purdue University School of Veterinary Medicine
West Lafayette, IN 47907-1243
Please feel free to make copies of this survey as needed. Additional copies may also be downloaded from the GRCA's web page at http://www.grca.org/ or by contacting the GRCA Administrative Assistant, Jolene Carey at (405)-752-8400.

The deadline for responses is November 1, 1998, after which time your questionnaire will not be included.

Thanks for your participation in this most important study. If you have any questions concerning this survey, please call Melissa Goodman, DVM at 215-248-2956.

## Selecting Dogs for Entry into the 1998 GRCA Health Survey

Each GRCA member may enter up to 5 dogs in this survey. Eligible dogs are those which were alive on January 1, 1993 and for which you know their life history. These dogs can either be alive now or have died since January 1, 1993. If you owned more than 5 dogs on January 1, 1993, arrange them according to the month of birth and select the first 5 for inclusion. Please complete a separate survey form for each of the dogs entered.

## I. General Owner Information

1. How many Golden Retrievers were living with you on Jan. 1, 1993:
2. How many Golden Retrievers are currently living with you:
3. How many years have you been in the breed:
4. What are your primary interests: (Check all that apply)
$\qquad$ Breeder $\qquad$ Show $\qquad$ Obedience $\qquad$ Agility
$\qquad$ Field Trials $\qquad$ Tracking $\qquad$ Search \& Rescue
___Companion/pet $\qquad$ Rescue $\qquad$ Hunting
5. What three diseases or health-related conditions do you feel are of the most concern for Golden Retrievers:
a)
b) $\qquad$
c)
c) $\qquad$

## Please fill out a separate form for each dog

## II. General Dog Information

1. Date of birth: $\qquad$ month $\qquad$ day $\qquad$ year
2. Sex: $\qquad$ male $\qquad$ female
3. Neutered $\qquad$ no $\qquad$ yes

If neutered, date of surgery: $\qquad$ month $\qquad$ year
4. For bitches only, has this dog ever had a litter: $\qquad$ yes $\qquad$ no

If yes, please complete following table:

| Litter \# | Month/Year | \# Live born | \# Still born | \# Weaned | Type of <br> Breeding <br> (use code below) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| \#1 |  |  |  |  |  |
| \#2 |  |  |  |  |  |
| \#3 |  |  |  |  |  |
| \#4 |  |  |  |  |  |

For Type of Breeding, please use the following code:
1=natural; 2=artificial insemination-fresh semen; 3=artificial insemination-chilled semen $4=$ artificial insemination-frozen semen
5. Where did you obtain this dog: $\qquad$ bred yourself $\qquad$ breeder (kennel)
$\qquad$ breeder (home) $\qquad$ shelter or rescue $\qquad$ pet store
$\qquad$ other (specify) $\qquad$
6. For what purpose was this dog bred?
$\qquad$ conformation $\qquad$ field trial/hunt test $\qquad$ obedience
$\qquad$ companion/pet $\qquad$ agility $\qquad$ tracking $\qquad$ hunting
7. State or country in which this dog spent most of its lifetime:
8. As a puppy ( $<9$ months), what rate of growth did you try to achieve:
$\qquad$ maximum $\qquad$ average $\qquad$ slow $\qquad$ don't know
9. As a puppy (< 9 months), would you characterize your dog as:
$\qquad$ obese $\qquad$ overweight $\qquad$ average or optimum weight
$\qquad$ underweight
10. As an adult ( $>9 \mathrm{mo}$.), what was the dog's usual: $\qquad$ weight (lb.) $\qquad$ height (in)
11. As an adult ( $>9 \mathrm{mo}$.), would you characterize your dog as:
$\qquad$ obese $\qquad$ overweight $\qquad$ average/optimum weight $\qquad$ underweight
12. As an adult ( $>9 \mathrm{mo}$.), would you characterize your dog as:
$\qquad$ large boned $\qquad$ medium boned $\qquad$ small boned
13. Please record the number of times fed in the appropriate boxes based on your dog's adult ( 9 mos.- 7 yr.) and senior (>7 yr.) diet:

| Type of Food | Frequency of Feeding |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Daily |  | Weekly |  | Monthly |  |
|  | Adult | Senior | Adult | Senior | Adult | Senior |
| Dry |  |  |  |  |  |  |
| Canned |  |  |  |  |  |  |
| Home prepared |  |  |  |  |  |  |
| Table scraps |  |  |  |  |  |  |
| Other (specify) |  |  |  |  |  |  |
|  |  |  |  |  |  |  |

14. For the commercial foods fed daily for the longest period of time, list the first four ingredients as stated on the label:

Dry: 1) 2) $\qquad$ 3) $\qquad$ 4) $\qquad$
If don't know, what is the Brand $\qquad$ $\boldsymbol{\&}$ Specific Food Type $\qquad$

## Canned

*1)
2) $\qquad$ 3) $\qquad$ 4) $\qquad$

* Do not include water as an ingredient

If don't know, what is the Brand $\qquad$ $\boldsymbol{\&}$ Specific Food Type $\qquad$
15. For the home prepared foods fed daily for the longest period of time, list the most common types fed:

## 1)

2) 
3) 
4) $\qquad$
16. Please check the boxes based on the supplements given your dog as an adult ( 9 mos.- 7 yr .) and senior (>7 yr.):

| Type of <br> Supplement | Frequency Supplements Given |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Daily |  | Weekly |  | Monthly |  |
|  | Adult | Senior | Adult | Senior | Adult | Senior |
| Multivitamins |  |  |  |  |  |  |
| Minerals |  |  |  |  |  |  |
| Other (specify) |  |  |  |  |  |  |
|  |  |  |  |  |  |  |

17. On average, how many shows a year did/does this dog attend (choose a typical year during which the dog was actively competing):
$\qquad$ field events $\qquad$ agility trials $\qquad$ obedience trials
$\qquad$ tracking tests $\qquad$ conformation shows
18. How is your dog primarily housed:
$\qquad$ in a crate in the house $\qquad$ kennel (indoor) $\qquad$ free in the house
$\qquad$ kennel (inside/outside) $\qquad$ fenced yard $\qquad$ garage
$\qquad$ Other (specify)
19. Does your dog sleep on your bed
$\qquad$ never $\qquad$ sometimes $\qquad$ usually
20. What is the current vital status of this dog:
$\qquad$ alive
$\qquad$ died $\qquad$ euthanatized
21. If died, date of death: $\qquad$ month $\qquad$ day $\qquad$ year
22. If died, what was the cause(s): $\qquad$
23. If died, was the above cause of death verified by a veterinarian: $\qquad$ yes $\qquad$ no
24. If died, was an autopsy performed: $\qquad$ yes $\qquad$ no

## III. Personality and Temperament

How would you rank your dog on a scale of 1 to 10 for each of the following characteristics? Please check the rank that applies:

1. Active or energetic
(activity level)
2. Excitable
3. Aggressive to dogs
4. Aggressive to people
5. Submissive to dogs
6. Submissive to people
7. Fearful of people
8. Fearful of environmental changes*
9. Happy
10. Trainable

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |

[^20]
## IV. Health Related Conditions

1. For each of the conditions listed below, please indicate those that affected your dog, the age at first diagnosis, whether a veterinarian confirmed that diagnosis, and if the condition was treated, cured, or a recurrent problem. Room is provided for you to list additional conditions.

| Condition | Age at Onset Years | $\begin{aligned} & \hline \text { Diagnosed by } \\ & \text { Veterinarian } \\ & \hline \end{aligned}$ |  | Treated |  | Cured |  | Recurrent Problem |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Yes | No | Yes | No | Yes | No | Yes | No |
| Neoplasms (Cancer) |  |  |  |  |  |  |  |  |  |
| Osteosarcoma |  |  |  |  |  |  |  |  |  |
| Lymphosarcoma |  |  |  |  |  |  |  |  |  |
| Testicular |  |  |  |  |  |  |  |  |  |
| Breast |  |  |  |  |  |  |  |  |  |
| Hemangiosarcoma |  |  |  |  |  |  |  |  |  |
| Mast cell |  |  |  |  |  |  |  |  |  |
| Squamous cell |  |  |  |  |  |  |  |  |  |
| Melanoma |  |  |  |  |  |  |  |  |  |
| Lipoma |  |  |  |  |  |  |  |  |  |
| Other |  |  |  |  |  |  |  |  |  |
| Cardiovascular |  |  |  |  |  |  |  |  |  |
| Heart failure-unknown cause |  |  |  |  |  |  |  |  |  |
| Cardiomyopathy |  |  |  |  |  |  |  |  |  |
| Heartworm Infection |  |  |  |  |  |  |  |  |  |
| Heart arrhythmia |  |  |  |  |  |  |  |  |  |
| Heart murmur |  |  |  |  |  |  |  |  |  |
| Pulmonic stenosis |  |  |  |  |  |  |  |  |  |
| Subaortic stenosis |  |  |  |  |  |  |  |  |  |
| Valve dysfunction |  |  |  |  |  |  |  |  |  |
| Other |  |  |  |  |  |  |  |  |  |

| Condition | Age at <br> Onset <br> Years | Diagnosed by Veterinarian |  | Treated |  | Cured |  | Recurrent Problem |  |

2. Please check the appropriate boxes according to your dog's vaccination schedule:

| Type of <br> Vaccination | Frequency of Vaccination |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | Sporadic | Yearly | Every 2 years | Every 3 years | Never |
| Rabies |  |  |  |  |  |
| Distemper |  |  |  |  |  |
| Parvovirus |  |  |  |  |  |
| Leptospirosis |  |  |  |  |  |
| Lyme disease |  |  |  |  |  |
| Kennel cough |  |  |  |  |  |
| Other_- |  |  |  |  |  |

3. Frequency of routine worming:
$\qquad$ Sporadic $\qquad$ Yearly $\qquad$ Every 2 years $\qquad$ Every 3 years $\qquad$ Never

Use of heartworm preventative:
$\qquad$ Sporadic $\qquad$ Monthly $\qquad$ Never
4. Please check the appropriate boxes based on your dog's exposure to chemicals and pesticides:

| Type of Exposure | Frequency of Exposure |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | Never | Sporadic | Weekly | Monthly |
| Contact with lawn <br> chemicals <br> Owner applied <br> Commercial applied |  |  |  |  |
| Tick/Flea dips |  |  |  |  |$\quad$| Tick/Flea products <br> applied as drops on skin |  |  |  |
| :--- | :--- | :--- | :--- |
| Tick/Flea shampoos |  |  |  |
| Tick/Flea sprays |  |  |  |
| Tick/Flea - other <br> Specify |  |  |  |
| Swimming |  |  |  |
| Pool |  |  |  |
| Fresh water |  |  |  |
| Salt water |  |  |  |

5. Was this dog ever involved in an automobile accident that required treatment by a veterinarian:
$\qquad$
$\qquad$ no
6. Did this dog ever receive professional counseling or behavior modification for a behavior problem? ___ yes ___ no
7. Was this dog ever medically treated for a behavior problem? $\qquad$ yes $\qquad$ no
8. Was euthanasia ever considered for a behavior problem? o
9. Has this dog ever had any adverse drug reactions?
10. Has this dog ever had any adverse drug reactions? $\qquad$ yes $\qquad$ yes no
$\qquad$
a. If yes, what was the specific drug involved:
b. Was this drug reaction diagnosed by a veterinarian? $\qquad$ yes $\qquad$ no
c. How old was the dog when this adverse drug reaction occurred? $\qquad$ years $\qquad$ months
11. Was this dog ever hospitalized for any health-related conditions other than those noted in the table starting on page 6? If YES, please specify $\qquad$

## V. Additional Comments

Please use the back of this page, if needed, to tell us anything about the health of this dog that was not covered in the questionnaire.

If you would like this dog entered into a future GRCA health and longevity survey or study, please indicate your willingness to participate by providing the information below.

Dog's registered name: $\qquad$
Dog's call name: $\qquad$
Your name: $\qquad$

The above information will be kept at Purdue University and will remain confidential.
Thank you for your participation in this health survey of Golden Retrievers. Please return your questionnaires to Purdue University in the envelope provided by November 1, 1998. Be assured that all information will be kept strictly confidential and names of participants will not be released. After Dr. Glickman analyzes the data at Purdue University, a detailed report will be sent to the Golden Retriever Club of America for publication.

[^0]:    ${ }^{a}$ Neuter status unknown for 24 (1.7\%) Golden Retrievers
    ${ }^{\mathrm{b}}$ Gender missing for two ( $0.1 \%$ ) Golden Retrievers
    ${ }^{\text {c }}$ Age of death missing for five Golden Retrievers (three bitches and two dogs)

[^1]:    ${ }^{\text {a }}$ Method of insemination missing for 13 bitches
    ${ }^{\mathrm{b}}$ SD=Standard Deviation
